CURRENT SEMAL RECURS

THE FAR EAST AND OCEANIA

U. S. DEPARTMENT OF AGRICULTURE ECONOMIC RESEARCH SERVICE Washington, D. C.

FOREWORD

This is the fifth annual Agricultural Data Book for the Far East and Oceania. Published in conjunction with The Far East and Oceania Agricultural Situation, it provides current and historical data on production and trade of agricultural products by the countries in those areas.

These data are useful in reviewing the current agricultural situation in the major food-deficit area of the world, including the South Asian subcontinent, Vietnam, and Japan, the No. 1 market for U.S. agricultural products. They are of value in analyzing trends in production and trade of agricultural products. They are utilized in market development, competition, and projection studies.

Indices of production data are used to measure changes in production of all agricultural products and of food production per capita by country and regions of the Far East and Oceania. They serve as indicators of agricultural growth. Aggregates of production, used in calculating the indices, show the relative importance of agricultural and food production among the several countries. Under a continuing arrangement, the Agency for International Development (AID) provided some financial assistance in the research for and preparation of these indices of production.

The value of U.S. trade in agricultural products, shown by their Standard International Trade Classification (SITC), is included in this publication to provide a more complete review of agricultural relations between the United States and the Far East countries. Use of commodity groups common to all countries permits comparisons not otherwise possible.

Data in this report were prepared in the Far East Branch, Foreign Regional Analysis Division, under the direction of Lorin O. Lovfald. Others participating in its preparation include Robert D. Barry, E. Wayne Denney, Charles E. Goode, Nancy W. Hancock, Mary E. Long, John B. Parker, Jr., and Virginia S. Salley.

INTRODUCTION

Indices of agricultural production in foreign countries have been prepared since World War II as part of a continuing assessment of the current agricultural situation abroad. During and immediately after the war the effort was focused on Europe. Since the middle 1950's special attention has been given to the less developed countries because of an arrangement with the Agency for International Development whereby the Department of Agriculture prepares annual reports on the volume of agricultural production in most countries which are aid recipients.

The indices presented on the following pages are constructed from production series given in metric tons, extending from 1961 through 1970 inclusive. To the extent possible, commodities were combined on a calendar year basis. Calendar year production includes crops harvested during the spring, summer and autumn of 1965 (for example) and includes some crops such as rice, where the bulk of the crop is harvested in 1965, but continued into the early part of 1966. The base period is the average of the calendar years 1961-65.

<u>Country Indices</u>. The formula for country indices is Laspeyres', the weights being estimated base-period average prices received by farmers, expressed in U.S. dollars per metric ton. When farm prices were not available it was necessary to use wholesale or export prices, adjusting to make them comparable to farm level.

Sources of Data. These indices are based on statistics of widely differing reliability. For most commodities, forecasts of production in the current year are published by Foreign Agricultural Service. These forecasts cover the major producing countries and are subsequently revised by the governments concerned or by FAS. For other commodities (e.g. millet, sorghum, bananas and cassava), FAS does not publish production statistics and ERS must rely on other sources, such as FAO and foreign governments, for historical data and on estimates, based largely on trends, for the current year. Statistics of livestock products are generally less reliable than figures for output of the principal commercial crops. All production figures are based on the latest information available to this office as of March 1, 1971.

Regional Indices. Indices of agricultural production are computed for 3 regions; South Asia, East Asia, and Oceania. Several smaller countries are omitted from the calculations for lack of data. The formula for the regional indices is a weighted-aggregative type, the regional aggregates being the sums of the country aggregates. This method is biased in favor of countries with relatively comprehensive commodity coverage or relatively high price weights, but the bias is not serious enough to offset the advantage of great flexibility in the grouping of countries into various alternative regions and subregions.

<u>Commodity Coverage</u>. In the country indices all major cash crops and subsistence crops have been included if current estimates of their production are obtainable. Hay and other crops grown for feeding on the farm have been omitted. Outputs of milk, eggs, poultry meat, wool, honey, and fur skins, if significant, have been included to the extent permitted by the quality of the data: Production of meat animals is represented for most countries by estimates of meat production.

Commodity Prices. Prices of agricultural commodities are generally reported in local currencies. Converting to U.S. dollars poses a problem. The currencies of many less developed countries were overvalued in varying degrees in the base-period years 1961-65. To convert with exchange rates at par value would give an unrealistic schedule of prices in U.S. dollars. Prices would be too high in proportion to the extent of currency depreciation. This would not affect the computation of an index for a given country, but it would cause difficulty when combining production of several countries to obtain a regional index.

Conversion of prices to U.S. dollars using free market exchange rates rather than official rates thereby offers a more standard basis for regional analysis. For this reason prices in countries included in this publication are converted to U.S. dollars using free market rates reported at Hong Kong. The exchange rates employed were gathered on a monthly basis and averaged over the five-year 1961-65 base period.

Feed Deduction. For Australia and Japan, the indices of agricultural production regard agriculture as consisting essentially of two farms, one with no livestock which produces only crops and one with grazing land but no crops which produces livestock products from pasture and from feed purchased either from the domestic crop farm or from abroad. Aggregates are published separately for crops and livestock, referring to the gross output of these two farms. When these two aggregates are combined, a deduction is made in most countries for livestock feed. This deduction is a fixed percentage of the livestock aggregate and represents the feed purchased by the national livestock farm.

The fixed percentage deduction for feed was derived by dividing the feed bill for the base period by the gross value of livestock output in the same years. The feed bill for the base period was calculated by applying to the grains, potatoes, and other crops fed the prices received by farmers, with no markup for transportation or compounding. In the case of byproduct feeds, such as bran, oilcake, molasses and brewers' grains, estimates of prices paid by farmers were used.

<u>Food Production Indices</u>. Index numbers of food production are computed for all countries and for regions. They are derived from the index numbers of agricultural production and differ only by the exclusion of inedible commodities and of coffee, tea, and spices.

Agricultural Trade. Data on agricultural trade shown in tables 23 through 50 are taken from the official customs returns of the respective countries. They include selected Standard International Trade Classification (SITC) groups of products that are agricultural or agricultural related. Trade of the United States shown in tables 51 through 68 with the same SITC groups are taken from foreign trade reports of the Bureau of the Census, U.S. Department of Commerce.
